

ASSIGNMENT—1.4

Q1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

ANS--

- GPU Brand – Intel
- Model Number – Intel UHD Graphics
- Integrated

Q2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

ANS—

Q3. Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

ANS —

Air Cooling	Liquid Cooling
Less Expensive	More Expensive
Good for normal and gaming use	Better for heavy gaming and high workloads
Easy to clean and maintain	Requires more maintenance and checking
Can be noisier under heavy load	Usually quieter during operation
Simple and easy to install	More difficult to install

Q4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3–4 sentences based on your research.

ANS –

I would choose **liquid cooling** for my GPU. It provides better cooling during long gaming and streaming sessions, which helps maintain good performance. It also keeps the GPU temperature lower and usually runs more quietly than air cooling. Although it is more expensive, it is a better choice for graphics-heavy games and streaming IPL matches.
